TO VAN D., PEREA J., JACQ C.;
SUBMITTED (SEP-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.
-: FUNCTION: MOLECULAR CHAPERONE; ASSIST THE FOLDING OF PROTEINS UPON ATP HYDROLYSIS. KNOWN TO PLAY A ROLE, IN VITRO, IN THE FOLDING OF ACTIN AND TUBULIN. IN YEAST MAY PLAY A ROLE IN MITOTIC SPINDLE FORMATION (BY SIMILARITY).
-: SUBCELDUAR LOCATION: CYTOPLASMIC (BY SIMILARITY).
-: SUBUNIT: HFTERO-OLIGOMERIC COMPLEX OF ABOUT 850 TO 900 KD THAT FORMS TWO STACKED RINGS, 12 TO 16 NM IN DIAMMERER (BY SIMILARITY).
-: SIMILARITY: TO OTHER MEMBERS OF TCP-1 CHAPERONIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=12067;

NUCLEIC ACIDS RES. 18.4018-4018(1990).
-!- FOUNCION: THE PROTEBACOME IS A MULTICATALYTIC PROTEINASE COMPLEX WHICH IS CHARACTERIZED BY ITS ABILITY TO CLEAVE PEPTIDES WITH ARG, PHE, TYR, LEU, AND GLU ADJACENT TO THE LEAVING GROUP AT NEUTRAL OR SLIGHTLY BASIC PH. THE PROTEASOME HAS AN ATP-DEPENDENT PROTEOLYTIC ACITYLIY.
-!- PATHWAY: IS INVOLVED IN AN ATP/UBIQUITIN-DEPENDENT NON-LYSOSOMAL PROTEOLYTIC PATHWAY:
-:- SUBUNIT: THE PROTESSOME IS COMPOSED OF AT LEAST IS NON IDENTICAL SUBUNITS WHICH FORM A HIGHLY ORDERED RING-SHAPED STRUCTURE.
-!- SUBCELLULAR LOCATION: PROTEASOMES ARE FOUND IN THE CYTOPLASM AND ALSO IN THE NUCLEUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-NOV-1990 (REL. 16, CREATED)

Claim 81, Fig 53, 184pp. English.

CDNA2 is a melanoma antigen (MART-1) which is recognized by
T-lymphocytes, and is a derivative of the melanocyte-melanoma-
ppecific antigen gp100 (see R84855). Antigen cDNA25 is a source
of immunogenic peptides (see R84855). Antigen cDNA25 is a source
(see R84200-R84211) to enhance their binding to a MRC molecule and
used in medicaments, especially vaccines, for the treatment or
prevention (by immunisation) of melanoma. Antibodies against cDNA2
and its immunogenic peptides may be used in the detection and
isolation of the antigen from a sample, the detection of which is
indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     claim 1; Page 22-24; 40pp; English.

Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be
                                                                                                                                                          DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Melanoma associated antigen \operatorname{gpl00} - used in vaccines and for the detection of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22-JAN-1996 (first entry)
Melanoma associated antigen gp100.
Melanoma; antigen; vaccine; immunogen; primer; probe; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cultured ex vivo and returned to melanoma particles, and when radiolabelled, they may be used to identify tumour deposits. Claim 1, Page 74-77, 115p; English.

Claim 1, Page 74-77, 115p; English.

Coded by clones of the plasmid pud4-5-CDKBP. CDK4 binding proteins.

CCDK4-BP) may be used in an assay for screening test compounds as inhibitors of CDK/CDK4-BP interaction. The complexes formed by CDK4 and D-type cyclins are strongly implicated in the control of the early claim and D-type cyclins are strongly implicated in the control of the early claim and D-type cycling are strong candidates for controlling and/or preventing tumourigenesis and the onset of cancer. Nucleic acids encoding CDK4 BP or fragments of these may be used as probes/primers to diagnose the presence or absence of genetic lesions in a gene encoding 1 of the 24 CDK4-BP, and hence to diagnose the risk for a subject of developing a cell-proliferation associated disorder (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Mutant M13 is one of 17 modified CD4 proteins analysed for class II
MHC binding. It corresponds to domains I and II of the human CD4
protein in which Glu at position 150 is replaced with Arg. Mutant
retains its Class II MHC binding affinity.
See R12951-R12967.

Bron Stander Janger Jene Lacid bacteria - transformed with food protein prodn. From lactic acid bacteria - transformed with food prode plasmid having theta replication mechanism and stably maintained under non-selective conditions

PT maintained under non-selective conditions

PT maintained under non-selective conditions

CC The inventors claim a food grade plasmid in which the replican and any DNA sequences required for stable maintenance in the bacterium care derived from pwW02 originating from Lactococcus lactis subsp.

CC The inventors claim a food grade plasmid of 3.8kb. It replication via a theta-mechanism. Possible promoter and RBS sites upstream of the ORF or ere given in FT and the direct repeats in from of the rep protein care indicated. The ORF has extensive similarity to the ORF encoding concern in FT and the All section send of points of the or protein plasmids. Analagous to points 5 and a number of other lactococcal plasmids. Analagous to points preceded by a 2.5 bp 3 1/2 direct prepeat upstream of which an AT-rich sequence is present. Outside this region, a 1.8kb stretch was found that showed three different repeatluping the first repeated sequence of 50 bp concerning and just overlapping the first repeated sequence of 50 bp corepeat and in the 100 bp repeat, but is absent from the 200 bp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                          New gamma-amino butyric acid permease gene - for growth inhibition of microbial or plant cells or as selectable marker Disclosure; Fig 1; 15pp; German. The gene gabP is obtd. from the genome of E.coli K12 by cleavage with BamHI and HindIII. It encodes GABA permease. Overexpression of the gene in microbial or plant cells may be used to produce cytotoxic effects in microorganisms, plants, plant cells or seeds. It may also be used as a selectable marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                        08-FEB-1994 (first entry)
Sequence of gamma-amino butyric acid (GABA) permease encoded by
gabP gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

adversely affected. The neutral sites are identified by analysing the viral genome to identify ORFs which are likely to encode functional genes and selecting sites between such ORFs or within sequences for non-functional genes. The sequence shown is that transcribed from the vaccinia virus WR strain positions 23501-25000 contg. the regions covered by the four fragments SalF, G, H and I. The sequence was transcribed in all three reading frames to determine genuine vaccinia virus genes via codon usage, thus determining neutral sites. HPV DNA sequences may be inserted neutral sites, e.g. those encoding E6 or E7 of HPV 16 and 18 or mutants of these proteins. The recombinant virus vector may be used immunotherapeutically to activate cells of the immune system against HPV.

In situ production of a homologous autolysin or a heterologous autolysin from a food grade Gram positive bacteria, can be used in a process for the lysis of a culture of lactic acid bacteria. The process can be used in the manufacture of products containing cultures of lactic acid bacteria e.g. cheese, where the culture is lysed following the completion of fermentation. The enhanced induction of the autolysin is performed some hours after the fermentation is finished. No extra lysin meeds to be added and the lysin does not need to be isolated or encapsulated. The time of lysis can be precisely controlled. This is the Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Rew tocopherol cyclase in homogeneous form - which acts on phytyl benzo:quinol derivs. to produce R', R', R'-tocopherol cpds.

Rew tocopherol cyclase enzyme may be isolated from green algae, compared to provel tocopherol cyclase enzyme may be isolated from green algae, compared to the novel tocopherol cyclase enzyme may be isolated from green algae, compared to provel tocopherol cyclase enzyme may be isolated from green algae, compared to the novel tocopherol cyclase enzyme may be isolated from green algae, compared to the novel tocopherol cyclase enzyme may be isolated from green algae, compared to the novel tocopherol cyclase enzyme may be isolated from green algae, compared to the novel tocopherol cyclase enzyment shown (some residues uncertain). The TC can be used to convert phytyl benzoquinol derivs. to produce R', R', R'-tocopherols contains also R33193-203.
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Claim 15; Page 35-42; 70pp; English.

The Bacillus subtilis chromosomal DNA region comprises the srfA
operon which encodes the multienzyme complex surfactin synthetase
(MCSS). Analysis of the sequence showed four regions potentially
coding for proteins, a zone upstream of the first ORF contg, the
srfA operon promoter and a presumed terminator positioned downstream
of the stop codon of the fourth ORF. ORF2 encodes a protein
(shown) which can be divided into 3 adjacent repeat regions with
internal homology followed by a region (module B) of 500 amino acids
very similar to that of ORF1 and homologous to tyrocidin and gramicidin
synthetase subunits I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Multi-enzyme complex surfactin synthetase DNA - is isolated from Bacillus subtilis, and used for prodn. of surfactin for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-JUL-1993 (first entry)

-1- SUBUNIT: BC1 COMPLEX CONTAINS 10 SUBUNITS; 3 RESPIRATORY
SUBUNITS, 2 CORE PROTEINS AND 5 LOW-MOLECULAR WEIGHT PROTEINS.
-1- SUBCELLULAR LOCATION: MITOCHONDRIAL INNER MEMBRANE.
-1- SIMILARITY: TO RIESER PROTEINS FROM OTHER SOURCES (MITOCHONDRIA,
BACTERIAL, CHLOROPLAST).
EMBL: MA2442, CG206681; --

-:- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
-:- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
-:- FUNCTION: THE TRANSIT PEPTIDE OF THE RIESKE PROTEIN SEEMS TO FORM
PART OF THE BC1 COMPLEX IN BEEF AND IS CONSIDERED TO BE THE
SUBBNIT IX OF THAT COMPLEX.
-:- THE RIESKE PROTEIN IS A HIGH POTENTIAL 2FE-2S PROTEIN.

C. 1- SUBCELLUARN LOCATION: MITOCHONDRIAL MATRIX.

C. 1- SIGUE SPECIFICITY: EXPRESSED IN MOST TISSUES. HIGHER LEVELS

FOUND IN HEART, BRAIN, LIYER AND SKELETAL MUSCLE.

C. 1- SIMILARITY: BELONGS TO PEPTIDASE FAMILY $16; ALSO KNOWN AS THE

C. LON FAMILY OF ATP-DEPENDENT PROTEASES.

DR PROSITE: PS01046; LON_SER.

MYDROLASE; SERINE PROTEASE; AIP-BINDING; MITOCHONDRION;

-! CATALYTIC ACTIVITY: L. SERINE + H(2)O = PYRUVATE + NH(3) + H(2)O.

-! COFACTOR: PYRIDOXAL PHOSPHATE.

-! PATHWAY: GLUCONEGENESIS FROM SERINE.

-! SUBGUILT: HOMODIMER.

-! SUBCLILUTAR LOCATION: CYTOPLASMIC.

-! SIMILARITY: TO THREONINE DEHYDRATASES BIOSYNTHETIC AND CATABOLIC.

-! SIMILARITY: TO THREONINE DEHYDRATASES HOSYNTHETIC AND CATABOLIC.

-! FUNCTION: REVERSIBLE HYDRATATION OF CARBON DIOXIDE.
-! CATALYTIC ACTIVITY: H(2)CO(3) = CO(2) + H(2)O.
-! INDUCTION: BY SALT.
-! SIMILARITY: TO OTHER CARBONIC ANHYDRASES.
EMBL: U53811; G1431878; -.

ΡŢ	DNA encoding melanoma antiqens recognised by T-lymphocytes - also
ΡŢ	vectors, host cells and antibodies, used to detect, treat and
PT	immunise animal against melanoma.
PS	Claim 55; Page 131; 184pp; English.
ပ္ပ	The immunogenic peptide is derived from cDNA25 (R84854), a
ပ္ပ	melanoma antigen derivative of gp100 (see R84855). The
ខ	peptide and its derivatives (see R84200-R84211) are used in
ပ္ပ	
ပ္ပ	immunization) of melanoma. Antibodies against melanoma-specific
႘	antigens and its immunogenic peptides may be used in the
ပ္ပ	detection and isolation of the antigen from a sample, the
႘	detection of which is indicative of a disease state
ပ္ပ	(melanoma or metastatic melanoma).

The epitopes R82098-R82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection of tumours (214, 40pp; English.
Claim 1; Page 22-24, 40pp; English.
Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when readiolabelled, they may be used to identify tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Claim 81, Fig 7A: 184pp: Bnglish.

Claim 184pp: Bnglish.

Cof immuniseation) of melanoma. Antibodies against cDNA2 and its immunisation of melanoma. Antibodies against cDNA2 and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

R84837-853 are G9-280 peptides modified to improve immunogenicity.

R84837-853 are G9-280 peptides modified to improve immunogenicity.

G9-280 is an immunogenic peptide based on the melanoma derived antigen, gpl00 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                       Claim 81; Fig 5A, 184Pp. English.

CDNA2 is a melanoma antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen gp100 (see R8485). Antigen cDNA25 is a source of immunogenic peptides (see R84199) which are optionally modified (see R84200-R84211) to enhance their binding to a MHC molecule and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5; Page 108; 184pp; English.

R84837-853 are G9-280 peptides medified to improve immunogenicity.

G9-280 is an immunogenic peptide based on the melanoma derived antigen, gpl00 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

G9-280 is an immunogenic peptide based on the melanoma derived antigen, gpl00 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

11 Welanoma-specific immunogen comprises epitope(s) homologous with pMel.17 - are highly potent stimulators of HLA-A2+CTL's useful in adoptive immuno-therapy.

19 Melanoma-specific immunogen homologous with pMel.17 comprises one adoptive immunosen homologous with pMel.17 comprises one concern and perfect (s) 130; 148pp; English.

20 A melanoma-specific immunogen homologous with pMel.17 comprises one concern (s) 130; 148pp; English.

21 A melanoma-specific immunogen homologous with pMel.17 comprises one concern (s) 130; 148pp; English.

22 Claim 8; Page 130; 148pp; English.

23 R82194 capable of eliciting a CTL response. The epitopes R82098-concern (s) 148108 are of particular intersect. The immunogen can be used for partial protection in mammals against melanoma peptides which are channelogous with pMel.17 are highly potent stimulators of HLA-A2+concern (s) sequence so AA;

24 R82108 are of particular intersect. The immunocherapy or concorporated into immunogenic conjugates as vaccines.

A melanoma sepecific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82194 capable of eliciting a CTL response. The epitopes R82098-R82198 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or sequence 9 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5: Page 108: 184pp; English.

G9-280 is an immunogenic peptide based on the melanoma derived antigen, gpl00 (see R84206). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Melanoma-specific immunogen comprises epitope(s) homologous with page 10.7 - are highly potent stimulators of HLA-A2+CTL's useful in adoptive immuno-therapy
Claim 10; Page 90; 148pp; English.
A melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82108 are of particular interest. The immunogen can be used for particular interest. The immunogen can be used for particular interest. The immunogen can be used for particular in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The Social melanoma antigens recognised by T-lymphocytes - also

PAR encoding melanoma antigens recognised by T-lymphocytes - also

PAR encoding melanoma antigens recognised by T-lymphocytes - also

PAR encoding melanoma antigens with treat and antibodies, used to detect, treat and

Immunise animal against melanoma.

Example 5: Page 108: 184pp; English.

R44837-853 are 69-280 peptides modified to improve immunogenicity.

G9-280 is an immunogenic peptides are used in medicaments for the capmon of servention (by immunization) of melanoma. Antibodies

creatment or prevention (by immunization) of melanoma antibodies

against MART-1 and its immunogenic peptides may be used in the detection

and insolation of MART-1 from a sample, the detection of which is

indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-882108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Characterization of the fim2 and fim3 fimbrial subunit genes
of Bordetella bronchiseptica; role of Fim2 and Fim3
fimbriae and flagella in adhesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        B36186 *type complete

-1- DISEASE: BORDETELLA PERTUSSIS IS THE CAUSATIVE AGENT OF WHOOPING COUGH. AN ESSENTIAL STEP IN THE DISEASE PROCESS IS THE ATTACHMENT OF THE BACTERIA TO THE CILIATED EPITHELIUM OF THE RESPIRATION TRACT, ENABLING THE ORGANISM TO RESIST NORMAL HOST-CLEBARANCE MECHANISMS. IT IS UNCLEAR WHICH BACTERIAL CELL SURFACE COMPONENT ARE RESPONSIBLE FOR ADHERENCE BUT THE FIMBRIAE OF B.PERTUSSIS ARE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PRIME CANDIDATES FOR BEING INVOLVED IN THIS PROCESS.
-!- SUBCELLULAR LOCATION: PILI STRUCTURE ON THE CELL SURFACE.
-!- SIMILARITY: BELONGS TO THE FIMA/PAPA FAMILY OF FIMBRIA PROTEINS.

LIVEY I., DUGGLEBY C.J., ROBINSON A.;

MOLL MICROBIOL. 1: 203-209 (1987).

1- DISEASE: BORDETELLA PERTUSSIS IS THE CAUSATIVE AGENT OF WHOOPING COUGH. AN ESSENTIAL STEP IN THE DISEASE PROCESS IS THE ATTACHMENT OF THE ATTACHMENT OF THE DISEASE PROCESS.

TRACT, ENABLING THE ONGANISM IN THE SEPENTARIOR OF BRETUSSIS ARE PRIME CANDIDATES FOR BEING INVOLVED IN THIS PROCESS.

1- SUBJECTIOUR LOCATION: PILL STRUCTURE ON THE CELL SURFACE.

1- SIMILARITY: BELONGS TO THE FIMA/PAPA FAMILY OF FIMBRIA PROTEINS.

REMBL; Y03754; S03754.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N PYROPHOSPHATE + DNA(N).

-!- SUBUNIT: CONSISTS OF TWO SUBUNITS (258 KD AND 55 KD).

-!- DOMAIN: THE DNA POLYMERASE ACTIVITY DOMAIN RESIDES IN THE PROPERTY. WHILE THE C-TERMINUS IS NECESSARY FOR COMPLEXING SUBUNITS B AND C. THE C-TERMINUS MAY ALSO REGULATE THE CATALITIC ACTIVITIES OF THE ENTYME.

-!- IN EUKARYOTES THERE ARE FIVE DNA POLYMERASES: ALPHA, BETA, GAMMA, DELTA, AND EPSILON WHICH ARE RESPONSIBLE FOR DIFFERENT REACTIONS OF DNA SYNTHESIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A., AND SEQUENCE OF 48-51; 876-886 AND 1338-1344.
